1. **(50 pts) L-smooth functions.** Suppose the function $f : \mathbb{R}^n \rightarrow \mathbb{R}$ is convex and differentiable. Please prove that the following relations holds for all $x, y \in \mathbb{R}^n$ if f with an L -Lipschitz continuous conditions,

$$[1] \Rightarrow [2] \Rightarrow [3]$$

$$[1] \quad \langle \nabla f(x) - \nabla f(y), x - y \rangle \leq L \|x - y\|^2,$$

$$[2] \quad f(y) \leq f(x) + \nabla f(x)^T (y - x) + \frac{L}{2} \|y - x\|^2,$$

$$[3] \quad f(y) \geq f(x) + \nabla f(x)^T (y - x) + \frac{1}{2L} \|\nabla f(y) - \nabla f(x)\|^2, \forall x, y.$$

Solution:

2. **(50 pts) Backtracking line search.** Please show the convergence of backtracking line search on a m -strongly convex and M -smooth objective function f as

$$f\left(x^{(k)}\right) - p^{\star} \leq c^k \left(f\left(x^{(0)}\right) - p^{\star}\right)$$

where $c = 1 - \min\{2m\alpha, 2\beta\alpha m/M\} < 1$.

Algorithm 9.2 *Backtracking line search.*

given a descent direction Δx for f at $x \in \mathbf{dom} f$, $\alpha \in (0, 0.5)$, $\beta \in (0, 1)$.

$t := 1$.

while $f(x + t\Delta x) > f(x) + \alpha t \nabla f(x)^T \Delta x$, $t := \beta t$.

Solution:
