Outline

- Augmented Lagrangian method
- Alternating direction method of multipliers

Two-block problem

$$\begin{aligned} & \mathsf{minimize}_{\boldsymbol{x},\boldsymbol{z}} & & F(\boldsymbol{x},\boldsymbol{z}) := f_1(\boldsymbol{x}) + f_2(\boldsymbol{z}) \\ & \mathsf{subject to} & & \boldsymbol{A}\boldsymbol{x} + \boldsymbol{B}\boldsymbol{z} = \boldsymbol{b} \end{aligned}$$

where f_1 and f_2 are both convex

- this can also be solved via Douglas-Rachford splitting
- we will introduce another paradigm for solving this problem

Augmented Lagrangian method

Dual problem

$$\begin{aligned} & \text{minimize}_{\boldsymbol{x},\boldsymbol{z}} \quad f_1(\boldsymbol{x}) + f_2(\boldsymbol{z}) \\ & \text{subject to} \quad \boldsymbol{A}\boldsymbol{x} + \boldsymbol{B}\boldsymbol{z} = \boldsymbol{b} \end{aligned}$$

$$\Leftrightarrow \\ & \qquad \qquad \Leftrightarrow \\ & \text{maximize}_{\boldsymbol{\lambda}} \quad \min_{\boldsymbol{x},\boldsymbol{z}} \underbrace{f_1(\boldsymbol{x}) + f_2(\boldsymbol{z}) + \langle \boldsymbol{\lambda}, \boldsymbol{A}\boldsymbol{x} + \boldsymbol{B}\boldsymbol{z} - \boldsymbol{b} \rangle}_{=:\mathcal{L}(\boldsymbol{x},\boldsymbol{z},\boldsymbol{\lambda})} \underbrace{(\mathsf{Lagrangian})}_{=:\mathcal{L}(\boldsymbol{x},\boldsymbol{z},\boldsymbol{\lambda})} \underbrace{(\mathsf{Lagrangian})}_{\Leftrightarrow} \end{aligned}$$

$$\Leftrightarrow \\ & \qquad \qquad \Leftrightarrow \\ & \qquad \qquad \Rightarrow \\ & \qquad \qquad$$

Augmented Lagrangian method

$$\mathsf{minimize}_{\pmb{\lambda}} \ f_1^*(-\pmb{A}^{\top} \pmb{\lambda}) + f_2^*(-\pmb{B}^{\top} \pmb{\lambda}) + \langle \pmb{\lambda}, \pmb{b} \rangle$$

The proximal point method for solving this dual problem:

$$\boldsymbol{\lambda}^{t+1} = \arg\min_{\boldsymbol{\lambda}} \left\{ f_1^*(-\boldsymbol{A}^{\top}\boldsymbol{\lambda}) + f_2^*(-\boldsymbol{B}^{\top}\boldsymbol{\lambda}) + \langle \boldsymbol{\lambda}, \boldsymbol{b} \rangle + \frac{1}{2\rho} \|\boldsymbol{\lambda} - \boldsymbol{\lambda}^t\|_2^2 \right\}$$

As it turns out, this is equivalent to the augmented Lagrangian method (or the method of multipliers)

$$(\boldsymbol{x}^{t+1}, \boldsymbol{z}^{t+1}) = \arg\min_{\boldsymbol{x}, \boldsymbol{z}} \left\{ f_1(\boldsymbol{x}) + f_2(\boldsymbol{z}) + \frac{\rho}{2} \left\| \boldsymbol{A} \boldsymbol{x} + \boldsymbol{B} \boldsymbol{z} - \boldsymbol{b} + \frac{1}{\rho} \boldsymbol{\lambda}^t \right\|_2^2 \right\}$$
$$\boldsymbol{\lambda}^{t+1} = \boldsymbol{\lambda}^t + \rho (\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b})$$
(10.1)

Justification of (10.1)

$$\boldsymbol{\lambda}^{t+1} = \arg\min_{\boldsymbol{\lambda}} \left\{ f_1^*(-\boldsymbol{A}^\top\boldsymbol{\lambda}) + f_2^*(-\boldsymbol{B}^\top\boldsymbol{\lambda}) + \langle \boldsymbol{\lambda}, \boldsymbol{b} \rangle + \frac{1}{2\rho} \|\boldsymbol{\lambda} - \boldsymbol{\lambda}^t\|_2^2 \right\}$$

$$\Leftrightarrow \text{optimality condition}$$

$$\mathbf{0} \in -\boldsymbol{A}\partial f_1^*(-\boldsymbol{A}^\top\boldsymbol{\lambda}^{t+1}) - \boldsymbol{B}\partial f_2^*(-\boldsymbol{B}^\top\boldsymbol{\lambda}^{t+1}) + \boldsymbol{b} + \frac{1}{\rho} (\boldsymbol{\lambda}^{t+1} - \boldsymbol{\lambda}^t)$$

$$\Leftrightarrow \boldsymbol{\lambda}^{t+1} = \boldsymbol{\lambda}^t + \rho \big(\boldsymbol{A}\boldsymbol{x}^{t+1} + \boldsymbol{B}\boldsymbol{z}^{t+1} - \boldsymbol{b}\big)$$
 where (check: use the conjugate subgradient theorem)
$$\boldsymbol{x}^{t+1} := \arg\min_{\boldsymbol{x}} \left\{ \langle \boldsymbol{A}^\top\boldsymbol{\lambda}^{t+1}, \boldsymbol{x} \rangle + f_1(\boldsymbol{x}) \right\}$$

$$\boldsymbol{z}^{t+1} := \arg\min_{\boldsymbol{x}} \left\{ \langle \boldsymbol{B}^\top\boldsymbol{\lambda}^{t+1}, \boldsymbol{z} \rangle + f_2(\boldsymbol{z}) \right\}$$

Justification of (10.1)

$$\boldsymbol{x}^{t+1} := \arg\min_{\boldsymbol{x}} \left\{ \langle \boldsymbol{A}^{\top} \left[\boldsymbol{\lambda}^{t} + \rho \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b} \right) \right], \boldsymbol{x} \rangle + f_{1}(\boldsymbol{x}) \right\}$$

$$\boldsymbol{z}^{t+1} := \arg\min_{\boldsymbol{z}} \left\{ \langle \boldsymbol{B}^{\top} \left[\boldsymbol{\lambda}^{t} + \rho \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b} \right) \right], \boldsymbol{z} \rangle + f_{2}(\boldsymbol{z}) \right\}$$

$$\updownarrow$$

$$\boldsymbol{0} \in \boldsymbol{A}^{\top} \left[\boldsymbol{\lambda}^{t} + \rho \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b} \right) \right] + \partial f_{1}(\boldsymbol{x}^{t+1})$$

$$\boldsymbol{0} \in \boldsymbol{B}^{\top} \left[\boldsymbol{\lambda}^{t} + \rho \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b} \right) \right] + \partial f_{2}(\boldsymbol{z}^{t+1})$$

$$\updownarrow$$

$$(\boldsymbol{x}^{t+1}, \boldsymbol{z}^{t+1}) = \arg\min_{\boldsymbol{x}, \boldsymbol{z}} \left\{ f_{1}(\boldsymbol{x}) + f_{2}(\boldsymbol{z}) + \frac{\rho}{2} \left\| \boldsymbol{A} \boldsymbol{x} + \boldsymbol{B} \boldsymbol{z} - \boldsymbol{b} + \frac{1}{\rho} \boldsymbol{\lambda}^{t} \right\|_{2}^{2} \right\}$$

Augmented Lagrangian method (ALM)

$$egin{aligned} \left(m{x}^{t+1}, m{z}^{t+1}
ight) &= rg \min_{m{x}, m{z}} \left\{f_1(m{x}) + f_2(m{z}) + rac{
ho}{2} \left\|m{A}m{x} + m{B}m{z} - m{b} + rac{1}{
ho}m{\lambda}^t
ight\|_2^2
ight\} \ \left(ext{primal step}
ight) \ m{\lambda}^{t+1} &= m{\lambda}^t +
ho ig(m{A}m{x}^{t+1} + m{B}m{z}^{t+1} - m{b} ig) \end{aligned}$$

where $\rho > 0$ is penalty parameter

ALM aims to solve the following problem by alternating between primal and dual updates

$$\mathsf{maximize}_{\pmb{\lambda}} \ \mathsf{max}_{\pmb{x},\pmb{z}} \underbrace{f_1(\pmb{x}) + f_2(\pmb{z}) + \rho \langle \pmb{A}\pmb{x} + \pmb{B}\pmb{z} - \pmb{b}, \pmb{\lambda} \rangle + \frac{\rho}{2} \bigg\| \pmb{A}\pmb{x} + \pmb{B}\pmb{z} - \pmb{b} + \frac{1}{\rho} \pmb{\lambda} \bigg\|_2^2}_{2}$$

 $\mathcal{L}_{\alpha}(\boldsymbol{x},\boldsymbol{z},\boldsymbol{\lambda})$: augmented Lagrangian

Issues of augmented Lagrangian method

$$\left(\boldsymbol{x}^{t+1}, \boldsymbol{z}^{t+1}\right) = \arg\min_{\boldsymbol{x}, \boldsymbol{z}} \left\{ f_1(\boldsymbol{x}) + f_2(\boldsymbol{z}) + \frac{\rho}{2} \left\| \boldsymbol{A}\boldsymbol{x} + \boldsymbol{B}\boldsymbol{z} - \boldsymbol{b} + \frac{1}{\rho} \boldsymbol{\lambda}^t \right\|_2^2 \right\}$$

- the primal update step is often expensive as expensive as solving the original problem
- ullet minimization of x and z cannot be carried out separately

Rather than computing exact primal estimate for ALM, we might minimize \boldsymbol{x} and \boldsymbol{z} sequentially via alternating minimization

$$egin{aligned} oldsymbol{x}^{t+1} &= rg \min_{oldsymbol{x}} \left\{ f_1(oldsymbol{x}) + rac{
ho}{2} \left\| oldsymbol{A} oldsymbol{x} + oldsymbol{B} oldsymbol{z}^{t} - oldsymbol{b} + rac{1}{
ho} oldsymbol{\lambda}^{t} \right\|_{2}^{2}
ight\} \ oldsymbol{z}^{t+1} &= rg \min_{oldsymbol{z}} \left\{ f_2(oldsymbol{z}) + rac{
ho}{2} \left\| oldsymbol{A} oldsymbol{x}^{t+1} + oldsymbol{B} oldsymbol{z} - oldsymbol{b} + rac{1}{
ho} oldsymbol{\lambda}^{t} \right\|_{2}^{2}
ight\} \ oldsymbol{\lambda}^{t+1} &= oldsymbol{\lambda}^{t} +
ho \left(oldsymbol{A} oldsymbol{x}^{t+1} + oldsymbol{B} oldsymbol{z}^{t+1} - oldsymbol{b}
ight) \end{aligned}$$

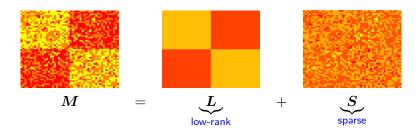

— called the alternating direction method of multipliers (ADMM)

$$x^{t+1} = \arg\min_{x} \left\{ f_1(x) + \frac{\rho}{2} \left\| Ax + Bz^t - b + \frac{1}{\rho} \lambda^t \right\|_2^2 \right\}$$

$$z^{t+1} = \arg\min_{z} \left\{ f_2(z) + \frac{\rho}{2} \left\| Ax^{t+1} + Bz - b + \frac{1}{\rho} \lambda^t \right\|_2^2 \right\}$$

$$\lambda^{t+1} = \lambda^t + \rho \left(Ax^{t+1} + Bz^{t+1} - b \right)$$

- ullet ho controls relative priority between primal and dual convergence
- ullet useful if updating $oldsymbol{x}^t$ and updating $oldsymbol{z}^t$ are both inexpensive
- blend the benefits of dual decomposition and augmented Lagrangian method
- ullet the roles of x and z are almost symmetric, but not quite

Suppose we observe ${\cal M}$, which is the superposition of a low-rank component ${\cal L}$ and sparse outliers ${\cal S}$

Can we hope to disentangle L and S?

One way to solve it is via convex programming (Candes et al. '08)

$$\begin{aligned} & \mathsf{minimize}_{\boldsymbol{L},\boldsymbol{S}} & & \|\boldsymbol{L}\|_* + \lambda \|\boldsymbol{S}\|_1 \\ & \mathsf{s.t.} & & \boldsymbol{L} + \boldsymbol{S} = \boldsymbol{M} \end{aligned} \tag{10.2}$$

where $\|\boldsymbol{L}\|_* := \sum_{i=1}^n \sigma_i(\boldsymbol{L})$ is the nuclear norm, and $\|\boldsymbol{S}\|_1 := \sum_{i,j} |S_{i,j}|$ is the entrywise ℓ_1 norm

ADMM for solving (10.2):

$$L^{t+1} = \arg\min_{\mathbf{L}} \left\{ \|\mathbf{L}\|_* + \frac{\rho}{2} \|\mathbf{L} + \mathbf{S}^t - \mathbf{M} + \frac{1}{\rho} \mathbf{\Lambda}^t \|_{\mathrm{F}}^2 \right\}$$

$$S^{t+1} = \arg\min_{\mathbf{S}} \left\{ \lambda \|\mathbf{S}\|_1 + \frac{\rho}{2} \|\mathbf{L}^{t+1} + \mathbf{S} - \mathbf{M} + \frac{1}{\rho} \mathbf{\Lambda}^t \|_{\mathrm{F}}^2 \right\}$$

$$\mathbf{\Lambda}^{t+1} = \mathbf{\Lambda}^t + \rho (\mathbf{L}^{t+1} + \mathbf{S}^{t+1} - \mathbf{M})$$

This is equivalent to

$$\begin{split} \boldsymbol{L}^{t+1} &= \mathsf{SVT}_{\rho^{-1}} \Big(\boldsymbol{M} - \boldsymbol{S}^t - \frac{1}{\rho} \boldsymbol{\Lambda}^t \Big) & \text{(singular value thresholding)} \\ \boldsymbol{S}^{t+1} &= \mathsf{ST}_{\lambda \rho^{-1}} \Big(\boldsymbol{M} - \boldsymbol{L}^{t+1} - \frac{1}{\rho} \boldsymbol{\Lambda}^t \Big) & \text{(soft thresholding)} \\ \boldsymbol{\Lambda}^{t+1} &= \boldsymbol{\Lambda}^t + \rho \left(\boldsymbol{L}^{t+1} + \boldsymbol{S}^{t+1} - \boldsymbol{M} \right) \end{split}$$

where for any $m{X}$ with SVD $m{X} = m{U} m{\Sigma} m{V}^{ op}$ $m{(\Sigma = \mathrm{diag}(\{\sigma_i\}))}$, one has

$$SVT_{\tau}(\boldsymbol{X}) = \boldsymbol{U} \operatorname{diag}(\{(\sigma_i - \tau)_+\}) \boldsymbol{V}^{\top}$$

$$\text{and} \qquad \left(\mathsf{ST}_{\tau}(\boldsymbol{X})\right)_{i,j} = \begin{cases} X_{i,j} - \tau, & \text{if } X_{i,j} > \tau \\ 0, & \text{if } |X_{i,j}| \leq \tau \\ X_{i,j} + \tau, & \text{if } X_{i,j} < -\tau \end{cases}$$

Example: graphical lasso

When learning a sparse Gaussian graphical model, one resorts to:

$$\begin{array}{ll} \mathsf{minimize}_{\boldsymbol{\Theta}} & \underbrace{-\log\det\boldsymbol{\Theta} + \langle\boldsymbol{\Theta},\boldsymbol{S}\rangle}_{\mathsf{negative log-likelihood of Gaussian graphical model}} + \underbrace{\lambda\|\boldsymbol{\Theta}\|_1}_{\mathsf{encourage sparsity}} \\ \mathsf{s.t.} & \boldsymbol{\Theta} \succeq \mathbf{0} \\ & \updownarrow \\ \mathsf{minimize}_{\boldsymbol{\Theta}} & -\log\det\boldsymbol{\Theta} + \langle\boldsymbol{\Theta},\boldsymbol{S}\rangle + \mathbb{I}_{\mathbb{S}_+}(\boldsymbol{\Theta}) + \lambda\|\boldsymbol{\Psi}\|_1 & \mathsf{(10.3)} \\ \mathsf{s.t.} & \boldsymbol{\Theta} = \boldsymbol{\Psi} \end{array}$$

ADMM 10-18

where $\mathbb{S}_+ := \{ \boldsymbol{X} \mid \boldsymbol{X} \succeq \boldsymbol{0} \}$

Example: graphical lasso

ADMM for solving (10.3):

$$\begin{aligned} \mathbf{\Theta}^{t+1} &= \arg\min_{\mathbf{\Theta}\succeq\mathbf{0}} \left\{ -\log\det\mathbf{\Theta} + \frac{\rho}{2} \left\| \mathbf{\Theta} - \mathbf{\Psi}^t + \frac{1}{\rho} \mathbf{\Lambda}^t + \frac{1}{\rho} \mathbf{S} \right\|_{\mathrm{F}}^2 \right\} \\ \mathbf{\Psi}^{t+1} &= \arg\min_{\mathbf{\Psi}} \left\{ \lambda \|\mathbf{\Psi}\|_1 + \frac{\rho}{2} \left\| \mathbf{\Theta}^{t+1} - \mathbf{\Psi} + \frac{1}{\rho} \mathbf{\Lambda}^t \right\|_{\mathrm{F}}^2 \right\} \\ \mathbf{\Lambda}^{t+1} &= \mathbf{\Lambda}^t + \rho \left(\mathbf{\Theta}^{t+1} - \mathbf{\Psi}^{t+1} \right) \end{aligned}$$

Example: graphical lasso

This is equivalent to

$$\begin{split} & \boldsymbol{\Theta}^{t+1} = \mathcal{F}_{\rho} \Big(\boldsymbol{\Psi}^t - \frac{1}{\rho} \boldsymbol{\Lambda}^t - \frac{1}{\rho} \boldsymbol{S} \Big) \\ & \boldsymbol{\Psi}^{t+1} = \mathsf{ST}_{\lambda \rho^{-1}} \Big(\boldsymbol{\Theta}^{t+1} + \frac{1}{\rho} \boldsymbol{\Lambda}^t \Big) \quad \text{(soft thresholding)} \\ & \boldsymbol{\Lambda}^{t+1} = \boldsymbol{\Lambda}^t + \rho \left(\boldsymbol{\Theta}^{t+1} - \boldsymbol{\Psi}^{t+1} \right) \end{split}$$

where for
$$m{X} = m{U} m{\Lambda} m{U}^ op \succeq m{0}$$
 with $m{\Lambda} = egin{bmatrix} \lambda_1 & & & \\ & \ddots & & \\ & & \lambda_n \end{bmatrix}$, one has $\mathcal{F}_{
ho}(m{X}) := rac{1}{2} m{U} \mathrm{diag}ig(\{\lambda_i + \sqrt{\lambda_i^2 + rac{4}{
ho}}\}ig) m{U}^ op$

Example: consensus optimization

Consider solving the following minimization problem

$$\begin{array}{c} \mathsf{minimize}_{\boldsymbol{x}} & \sum_{i=1}^N f_i(\boldsymbol{x}) \\ & \updownarrow \\ \mathsf{minimize} & \sum_{i=1}^N f_i(\boldsymbol{x}_i) \quad \mathsf{(block separable)} \\ \mathsf{s.t.} & \boldsymbol{x}_i = \boldsymbol{z} & 1 \leq i \leq N \\ & & \updownarrow \\ \mathsf{minimize} & \sum_{i=1}^N f_i(\boldsymbol{x}_i) \\ & \mathsf{s.t.} & \boldsymbol{u} := \left[\begin{array}{c} \boldsymbol{x}_1 \\ \vdots \\ \boldsymbol{x} \end{array} \right] = \left[\begin{array}{c} \boldsymbol{I} \\ \vdots \\ \boldsymbol{I} \end{array} \right] \boldsymbol{z} \end{array}$$

ADMM

Example: consensus optimization

ADMM for solving this problem:

$$\begin{aligned} \boldsymbol{u}^{t+1} &= \arg\min_{\boldsymbol{u} = [\boldsymbol{x}_i]_{1 \le i \le N}} \left\{ \sum_{i=1}^N f_i(\boldsymbol{x}_i) + \frac{\rho}{2} \sum_{i=1}^N \left\| \boldsymbol{x}_i - \boldsymbol{z}^t + \frac{1}{\rho} \boldsymbol{\lambda}_i^t \right\|_2^2 \right\} \\ \boldsymbol{z}^{t+1} &= \arg\min_{\boldsymbol{z}} \left\{ \frac{\rho}{2} \sum_{i=1}^N \left\| \boldsymbol{x}_i^{t+1} - \boldsymbol{z} + \frac{1}{\rho} \boldsymbol{\lambda}_i^t \right\|_2^2 \right\} \\ \boldsymbol{\lambda}_i^{t+1} &= \boldsymbol{\lambda}_i^t + \rho(\boldsymbol{x}_i^{t+1} - \boldsymbol{z}^{t+1}), \qquad 1 \le i \le N \end{aligned}$$

Example: consensus optimization

This is equivalent to

$$\begin{aligned} \boldsymbol{x}_i^{t+1} &= \arg\min_{\boldsymbol{x}_i} \left\{ f_i(\boldsymbol{x}_i) + \frac{\rho}{2} \| \boldsymbol{x}_i - \boldsymbol{z}^t + \frac{1}{\rho} \boldsymbol{\lambda}_i^t \|_2^2 \right\} & 1 \leq i \leq N \\ & \text{(can be computed in parallel)} \\ \boldsymbol{z}^{t+1} &= \frac{1}{N} \sum_{i=1}^N \left(\boldsymbol{x}_i^{t+1} + \frac{1}{\rho} \boldsymbol{\lambda}_i^t \right) \\ & \text{(gather all local iterates)} \\ \boldsymbol{\lambda}_i^{t+1} &= \boldsymbol{\lambda}_i^t + \rho(\boldsymbol{x}_i^{t+1} - \boldsymbol{z}^{t+1}), & 1 \leq i \leq N \end{aligned}$$

("broadcast" z^{t+1} to update all local multipliers)

ADMM is well suited for distributed optimization!

Convergence of ADMM

Theorem 10.1 (Convergence of ADMM)

Suppose f_1 and f_2 are closed convex functions, and γ is any constant obeying $\gamma \geq 2\|\boldsymbol{\lambda}^*\|_2$. Then

$$F(x^{(t)}, z^{(t)}) - F^{\mathsf{opt}} \le \frac{\|z^0 - z^*\|_{\rho B^\top B}^2 + \frac{\left(\gamma + \|\lambda^0\|_2\right)^2}{\rho}}{2(t+1)} \tag{10.4a}$$

$$\|\boldsymbol{A}\boldsymbol{x}^{(t)} + \boldsymbol{B}\boldsymbol{z}^{(t)} - \boldsymbol{b}\|_{2} \le \frac{\|\boldsymbol{z}^{0} - \boldsymbol{z}^{*}\|_{\rho \boldsymbol{B}^{\top} \boldsymbol{B}}^{2} + \frac{(\gamma + \|\boldsymbol{\lambda}^{0}\|_{2})^{2}}{\rho}}{\gamma(t+1)}$$
 (10.4b)

where
$$m{x}^{(t)} := rac{1}{t+1} \sum_{k=1}^{t+1} m{x}^k, \; m{z}^{(t)} := rac{1}{t+1} \sum_{k=1}^{t+1} m{z}^k$$
, and for any $m{C}$, $\|m{z}\|_{m{C}}^2 := m{z}^{ op} m{C} m{z}$

- convergence rate: O(1/t)
- iteration complexity: $O(1/\varepsilon)$

Fundamental inequality

Define

$$egin{aligned} m{w} &:= \left[egin{aligned} m{x} \ m{z} \ m{\lambda} \end{array}
ight], \; m{w}^t := \left[egin{aligned} m{x}^t \ m{z}^t \ m{\lambda}^t \end{array}
ight], \; m{G} := \left[egin{aligned} m{A}^ op \ m{B}^ op \end{array}
ight], \; m{d} := \left[egin{aligned} m{0} \ m{0} \ m{b} \end{array}
ight] \ m{H} := \left[m{0} &
ho m{B}^ op m{B} & \
ho^{-1} m{I} \end{array}
ight], & \|m{w}\|_{m{H}}^2 := m{w}^ op m{H} m{w} \end{aligned}$$

Lemma 10.2

For any x, z, λ , one has

$$F(x, z) - F(x^{t+1}, z^{t+1}) + \langle w - w^{t+1}, Gw + d \rangle$$

$$\geq \frac{1}{2} ||w - w^{t+1}||_{H}^{2} - \frac{1}{2} ||w - w^{t}||_{H}^{2}$$

ADMM

Proof of Theorem 10.1

Set $x=x^*$, $z=z^*$, and $w=[x^{*\top},z^{*\top},\boldsymbol{\lambda}^{\top}]^{\top}$ in Lemma 10.2 to reach

$$F(\boldsymbol{x}^*, \boldsymbol{z}^*) - F(\boldsymbol{x}^{k+1}, \boldsymbol{z}^{k+1}) + \langle \boldsymbol{w} - \boldsymbol{w}^{k+1}, \boldsymbol{G} \boldsymbol{w} + \boldsymbol{d} \rangle \ge \underbrace{\frac{\|\boldsymbol{w} - \boldsymbol{w}^{k+1}\|_{\boldsymbol{H}}^2}{2}}_{2} - \underbrace{\frac{\|\boldsymbol{w} - \boldsymbol{w}^k\|_{\boldsymbol{H}}^2}{2}}_{2}$$

Summing over all $k = 0, \dots, t$ gives

$$(t+1)F(\boldsymbol{x}^*, \boldsymbol{z}^*) - \sum_{k=1}^{t+1} F(\boldsymbol{x}^k, \boldsymbol{z}^k) + \left\langle (t+1)\boldsymbol{w} - \sum_{k=1}^{t+1} \boldsymbol{w}^k, \boldsymbol{G}\boldsymbol{w} + \boldsymbol{d} \right\rangle$$

$$\geq \frac{\|\boldsymbol{w} - \boldsymbol{w}^{t+1}\|_{\boldsymbol{H}}^2 - \|\boldsymbol{w} - \boldsymbol{w}^0\|_{\boldsymbol{H}}^2}{2}$$

If we define

ADMM

$$oldsymbol{w}^{(t)} = rac{1}{t+1} \sum_{k=1}^{t+1} oldsymbol{w}^k, \ oldsymbol{x}^{(t)} = rac{1}{t+1} \sum_{k=1}^{t+1} oldsymbol{x}^k, \ oldsymbol{z}^{(t)} = rac{1}{t+1} \sum_{k=1}^{t+1} oldsymbol{z}^k, oldsymbol{\lambda}^{(t)} = rac{1}{t+1} \sum_{k=1}^{t+1} oldsymbol{\lambda}^k,$$

then from convexity of F we have

$$F(\boldsymbol{x}^{(t)}, \boldsymbol{z}^{(t)}) - \underbrace{F(\boldsymbol{x}^*, \boldsymbol{z}^*)}_{\text{Cort}} + \left\langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w} + \boldsymbol{d} \right\rangle \leq \frac{1}{2(t+1)} \|\boldsymbol{w} - \boldsymbol{w}^0\|_{\boldsymbol{H}}^2$$

10-26

forms telescopic sum

Proof of Theorem 10.1

Further, we claim that

$$\langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w} + \boldsymbol{d} \rangle = \langle \boldsymbol{\lambda}, \boldsymbol{A} \boldsymbol{x}^{(t)} + \boldsymbol{B} \boldsymbol{z}^{(t)} - \boldsymbol{b} \rangle$$
 (10.5)

which together with preceding bounds yields

$$F(\boldsymbol{x}^{(t)}, \boldsymbol{z}^{(t)}) - F^{\mathsf{opt}} + \langle \boldsymbol{\lambda}, \boldsymbol{A} \boldsymbol{x}^{(t)} + \boldsymbol{B} \boldsymbol{z}^{(t)} - \boldsymbol{b} \rangle \leq \frac{1}{2(t+1)} \| \boldsymbol{w} - \boldsymbol{w}^0 \|_{\boldsymbol{H}}^2$$
$$= \frac{1}{2(t+1)} \left\{ \| \boldsymbol{z} - \boldsymbol{z}^0 \|_{\rho \boldsymbol{B}^\top \boldsymbol{B}}^2 + \frac{1}{\rho} \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^0 \|_2^2 \right\}$$

Notably, this holds for any λ

Taking maximum of both sides over $\{\lambda \mid ||\lambda||_2 \leq \gamma\}$ yields

$$F(\boldsymbol{x}^{(t)}, \boldsymbol{z}^{(t)}) - F^{\text{opt}} + \gamma \|\boldsymbol{A}\boldsymbol{x}^{(t)} + \boldsymbol{B}\boldsymbol{z}^{(t)} - \boldsymbol{b}\|_{2}$$

$$\leq \frac{\left\{\|\boldsymbol{z} - \boldsymbol{z}^{0}\|_{\rho \boldsymbol{B}^{\top} \boldsymbol{B}}^{2} + \frac{\left(\gamma + \|\boldsymbol{\lambda}^{0}\|_{2}\right)^{2}}{\rho}\right\}}{2(t+1)}$$
(10.6)

which immediately establishes (10.4a)

Proof of Theorem 10.1 (cont.)

Caution needs to be exercised since, in general, (10.6) does not establish (10.4b), since $F(\boldsymbol{x}^{(t)}, \boldsymbol{z}^{(t)}) - F^{\text{opt}}$ may be negative (as $(\boldsymbol{x}^{(t)}, \boldsymbol{z}^{(t)})$ is not guaranteed to be feasible)

Fortunately, if $\gamma \geq 2\|\pmb{\lambda}^*\|_2$, then standard results (e.g. Theorem 3.60 in Beck '18) reveal that $F(\pmb{x}^{(t)}, \pmb{z}^{(t)}) - F^{\text{opt}}$ will not be "too negative", thus completing proof

Proof of Theorem 10.1

Finally, we prove (10.5). Observe that

$$\langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w} + \boldsymbol{d} \rangle = \underbrace{\langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} (\boldsymbol{w} - \boldsymbol{w}^{(t)}) \rangle}_{=0 \text{ since } \boldsymbol{G} \text{ is skew-symmetric}} + \langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w}^{(t)} + \boldsymbol{d} \rangle$$

$$= \langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w}^{(t)} + \boldsymbol{d} \rangle$$

$$(10.7)$$

To further simplify this inner product, we use $Ax^*+Bz^*=b$ to obtain

$$\begin{split} \left\langle \boldsymbol{w}^{(t)} - \boldsymbol{w}, \boldsymbol{G} \boldsymbol{w}^{(t)} + \boldsymbol{d} \right\rangle &= \left\langle \boldsymbol{x}^{(t)} - \boldsymbol{x}^*, \boldsymbol{A}^\top \boldsymbol{\lambda}^{(t)} \right\rangle + \left\langle \boldsymbol{z}^{(t)} - \boldsymbol{z}^*, \boldsymbol{B}^\top \boldsymbol{\lambda}^{(t)} \right\rangle \\ &+ \left\langle \boldsymbol{\lambda}^{(t)} - \boldsymbol{\lambda}, -\boldsymbol{A} \boldsymbol{x}^{(t)} - \boldsymbol{B} \boldsymbol{z}^{(t)} + \boldsymbol{b} \right\rangle \\ &= \left\langle -\boldsymbol{A} \boldsymbol{x}^* - \boldsymbol{B} \boldsymbol{z}^* + \boldsymbol{b}, \boldsymbol{\lambda}^{(t)} \right\rangle + \left\langle \boldsymbol{\lambda}, \boldsymbol{A} \boldsymbol{x}^{(t)} + \boldsymbol{B} \boldsymbol{z}^{(t)} - \boldsymbol{b} \right\rangle \\ &= \left\langle \boldsymbol{\lambda}, \boldsymbol{A} \boldsymbol{x}^{(t)} + \boldsymbol{B} \boldsymbol{z}^{(t)} - \boldsymbol{b} \right\rangle \end{split}$$

Proof of Lemma 10.2

To begin with, ADMM update rule requires

$$-
ho oldsymbol{A}^ op \left(oldsymbol{A} oldsymbol{x}^{t+1} + oldsymbol{B} oldsymbol{z}^t - oldsymbol{b} + rac{1}{
ho} oldsymbol{\lambda}^t
ight) \in \partial f_1(oldsymbol{x}^{t+1})
onumber \ -
ho oldsymbol{B}^ op \left(oldsymbol{A} oldsymbol{x}^{t+1} + oldsymbol{B} oldsymbol{z}^{t+1} - oldsymbol{b} + rac{1}{
ho} oldsymbol{\lambda}^t
ight) \in \partial f_2(oldsymbol{z}^{t+1})$$

Therefore, for any $oldsymbol{x},oldsymbol{z}$,

$$f_1(\boldsymbol{x}) - f_1(\boldsymbol{x}^{t+1}) + \left\langle \rho \boldsymbol{A}^\top \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^t - \boldsymbol{b} + \frac{1}{\rho} \boldsymbol{\lambda}^t \right), \boldsymbol{x} - \boldsymbol{x}^{t+1} \right\rangle \ge 0$$

$$f_2(\boldsymbol{z}) - f_2(\boldsymbol{z}^{t+1}) + \left\langle \rho \boldsymbol{B}^\top \left(\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b} + \frac{1}{\rho} \boldsymbol{\lambda}^t \right), \boldsymbol{z} - \boldsymbol{z}^{t+1} \right\rangle \ge 0$$

Proof of Lemma 10.2 (cont.)

Using $\boldsymbol{\lambda}^{t+1} = \boldsymbol{\lambda}^t + \rho(\boldsymbol{A}\boldsymbol{x}^{t+1} + \boldsymbol{B}\boldsymbol{z}^{t+1} - \boldsymbol{b})$, setting $\tilde{\boldsymbol{\lambda}}^t := \boldsymbol{\lambda}^t + \rho(\boldsymbol{A}\boldsymbol{x}^{t+1} + \boldsymbol{B}\boldsymbol{z}^t - \boldsymbol{b})$, and adding above two inequalities give

$$F(\boldsymbol{x}, \boldsymbol{z}) - F(\boldsymbol{x}^{t+1}, \boldsymbol{z}^{t+1}) + \left\langle \begin{bmatrix} \boldsymbol{x} - \boldsymbol{x}^{t+1} \\ \boldsymbol{z} - \boldsymbol{z}^{t+1} \\ \boldsymbol{\lambda} - \tilde{\boldsymbol{\lambda}}^t \end{bmatrix}, \begin{bmatrix} \boldsymbol{A}^{\top} \tilde{\boldsymbol{\lambda}}^t \\ \boldsymbol{B}^{\top} \tilde{\boldsymbol{\lambda}}^t \\ -\boldsymbol{A} \boldsymbol{x}^{t+1} - \boldsymbol{B} \boldsymbol{z}^{t+1} + \boldsymbol{b} \end{bmatrix} - \begin{bmatrix} \boldsymbol{0} \\ \rho \boldsymbol{B}^{\top} \boldsymbol{B} (\boldsymbol{z}^t - \boldsymbol{z}^{t+1}) \\ \frac{1}{\rho} (\boldsymbol{\lambda}^t - \boldsymbol{\lambda}^{t+1}) \end{bmatrix} \right\rangle \geq 0$$

$$(10.8)$$

Next, we'd like to simplify above inner product. Let $C := \rho B^{\top} B$, then

$$(\boldsymbol{z} - \boldsymbol{z}^{t+1})^{\top} \boldsymbol{C} (\boldsymbol{z}^{t} - \boldsymbol{z}^{t+1}) = \frac{1}{2} \|\boldsymbol{z} - \boldsymbol{z}^{t+1}\|_{\boldsymbol{C}}^{2} - \frac{1}{2} \|\boldsymbol{z} - \boldsymbol{z}^{t}\|_{\boldsymbol{C}}^{2} + \frac{1}{2} \|\boldsymbol{z}^{t} - \boldsymbol{z}^{t+1}\|_{\boldsymbol{C}}^{2}$$

Proof of Lemma 10.2 (cont.)

Also,

$$\begin{split} & 2(\boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1})^{\top} (\boldsymbol{\lambda}^{t} - \boldsymbol{\lambda}^{t+1}) \\ & = \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1} \|_{2}^{2} - \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t} \|_{2}^{2} + \| \tilde{\boldsymbol{\lambda}}^{t} - \boldsymbol{\lambda}^{t} \|_{2}^{2} - \| \tilde{\boldsymbol{\lambda}}^{t} - \boldsymbol{\lambda}^{t+1} \|_{2}^{2} \\ & = \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1} \|_{2}^{2} - \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t} \|_{2}^{2} + \rho^{2} \| \boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t} - \boldsymbol{b} \|_{2}^{2} \\ & - \| \boldsymbol{\lambda}^{t} + \rho (\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t} - \boldsymbol{b}) - \boldsymbol{\lambda}^{t} - \rho (\boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t+1} - \boldsymbol{b}) \|_{2}^{2} \\ & = \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1} \|_{2}^{2} - \| \boldsymbol{\lambda} - \boldsymbol{\lambda}^{t} \|_{2}^{2} + \rho^{2} \| \boldsymbol{A} \boldsymbol{x}^{t+1} + \boldsymbol{B} \boldsymbol{z}^{t} - \boldsymbol{b} \|_{2}^{2} \\ & - \rho^{2} \| \boldsymbol{B} (\boldsymbol{z}^{t} - \boldsymbol{z}^{t+1}) \|_{2}^{2} \end{split}$$

which implies that

$$\begin{aligned} &2(\boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1})^{\top}(\boldsymbol{\lambda}^{t} - \boldsymbol{\lambda}^{t+1}) \\ &\geq \|\boldsymbol{\lambda} - \boldsymbol{\lambda}^{t+1}\|_{2}^{2} - \|\boldsymbol{\lambda} - \boldsymbol{\lambda}^{t}\|_{2}^{2} - \rho^{2} \|\boldsymbol{B}(\boldsymbol{z}^{t} - \boldsymbol{z}^{t+1})\|_{2}^{2} \end{aligned}$$

Proof of Lemma 10.2 (cont.)

Combining above results gives

$$\begin{split} & \left\langle \begin{bmatrix} \boldsymbol{x} - \boldsymbol{x}^{t+1} \\ \boldsymbol{z} - \boldsymbol{z}^{t+1} \\ \boldsymbol{\lambda} - \tilde{\boldsymbol{\lambda}}^t \end{bmatrix}, \begin{bmatrix} \boldsymbol{0} \\ \rho \boldsymbol{B}^{\top} \boldsymbol{B} (\boldsymbol{z}^t - \boldsymbol{z}^{t+1}) \\ \frac{1}{\rho} (\boldsymbol{\lambda}^t - \boldsymbol{\lambda}^{t+1}) \end{bmatrix} \right\rangle \\ & \geq \frac{1}{2} \| \boldsymbol{w} - \boldsymbol{w}^{t+1} \|_{\boldsymbol{H}}^2 - \frac{1}{2} \| \boldsymbol{w} - \boldsymbol{w}^t \|_{\boldsymbol{H}}^2 + \frac{1}{2} \| \boldsymbol{z}^t - \boldsymbol{z}^{t+1} \|_{\boldsymbol{C}}^2 - \frac{\rho}{2} \| \boldsymbol{B} (\boldsymbol{z}^t - \boldsymbol{z}^{t+1}) \|_2^2 \\ & = \frac{1}{2} \| \boldsymbol{w} - \boldsymbol{w}^{t+1} \|_{\boldsymbol{H}}^2 - \frac{1}{2} \| \boldsymbol{w} - \boldsymbol{w}^t \|_{\boldsymbol{H}}^2 \end{split}$$

This together with (10.8) yields

$$F(x, z) - F(x^{t+1}, z^{t+1}) + \langle w - w^{t+1}, Gw^{t+1} + d \rangle$$

 $\geq \frac{1}{2} \|w - w^{t+1}\|_{H}^{2} - \frac{1}{2} \|w - w^{t}\|_{H}^{2}$

Since G is skew-symmetric, repeating prior argument in (10.7) gives

$$\langle oldsymbol{w} - oldsymbol{w}^{t+1}, oldsymbol{G} oldsymbol{w}^{t+1} + oldsymbol{d}
angle = \langle oldsymbol{w} - oldsymbol{w}^{t+1}, oldsymbol{G} oldsymbol{w} + oldsymbol{d}
angle$$

This immediately completes proof

Convergence of ADMM in practice

- ADMM is slow to converge to high accuracy
- ADMM often converges to modest accuracy within a few tens of iterations, which is sufficient for many large-scale applications

Beyond two-block models

Convergence is not guaranteed when there are 3 or more blocks

• e.g. consider solving

$$x_1 a_1 + x_2 a_2 + x_3 a_3 = 0$$

where

$$[\boldsymbol{a}_1, \boldsymbol{a}_2, \boldsymbol{a}_3] = \left[egin{array}{ccc} 1 & 1 & 1 \ 1 & 1 & 2 \ 1 & 2 & 2 \end{array}
ight]$$

3-block ADMM is divergent for solving this problem (Chen et al. '16)
